

IPV IDEASCHOOL — WINTER EDITION 2026 · APPLICATION

LIMEPAPER

Paper made from stone, not trees.

A tree-free, water-free packaging and stationery substrate, extruded from Rajasthan's own marble-slurry waste — where the waste is, not where it's shipped in from.

Kishangarh-Rajsamand, Rajasthan · Founded 2026 · futurist.raghav@gmail.com

A waste stream with no buyer, and a paper industry that can no longer lean on trees

A POLLUTION LIABILITY

Kishangarh and Rajsamand's marble industry produces limestone/marble slurry that CPCB and NGT already classify as a pollution hazard. There's no cost-effective disposal route today — it's waste looking for an offtaker, not a scarce input anyone has to compete for.

A PACKAGING INDUSTRY UNDER PRESSURE

India's single-use-plastic rules and FMCG ESG mandates are pushing packaging and stationery buyers toward alternatives to both plastic *and* wood-pulp paper. No Indian company currently owns a captive, mine-mouth supply chain for the obvious answer.

Read as a warning, not just an opportunity: the one branded Indian attempt at this — Ston2pack — has gone quiet since 2022-23. Finding out why is the first thing we're doing with this, not an afterthought.

Stone paper: ground limestone standing in for wood pulp

80% limestone / marble waste

18% HDPE

2% additive not labeled – too narrow to fit

WATER

None used in production

WOOD PULP

None — no trees felled

ENERGY

≈¹/₄ of conventional
papermaking

HANDLING

Tear-resistant and waterproof

₹24–32K

our cost / tonne (materials + energy)

vs.

₹42–73K+

wood-pulp paper / tonne, current wood prices

Why us: a captive, mine-mouth position near Kishangarh/Rajsamand – feedstock security, near-zero logistics cost, and a circular-economy story no current competitor claims.

Two channels off the same extrusion line

CHANNEL 1 — PRIMARY, STAGE 1

Raw substrate

Sheet and roll stock sold to converters and brands who finish it themselves. B2B. This is the Stage 1 plan, sequenced first because it needs no brand, no retail channel and no certification to start.

CHANNEL 2

Finished branded goods

Ten SKUs — labels, tags, cartons, notebooks, wallpaper, carry bags — converted in-house. Starts as in-house consumption (our own packaging) before we sell it externally.

Sequencing: B2B before B2C. Corporate gifting is the first accessible segment — seasonal, low switching cost, zero certification barrier. Pharma and industrial labels are Year 3+ targets, once the line has 12+ months of consistent quality behind it.

Three people, not two — and the third is formal, not informal

FOUNDERS, AGE 18

Product · B2B sales · Brand

Run the digitally-native, relationship-building front end: buyer outreach, product decisions, brand and content — the energy-intensive work of finding the first anchor customers.

CO-FOUNDER

Father — operations & credit

~4 years of carton-industry experience (2022–present). Runs day-to-day factory-floor operations and vendor/landlord/local-official relationships — and is formally on the entity as co-applicant/guarantor, required for financing at this scale.

Structured into the entity from day one — not left as an informal family arrangement to sort out later.

Pre-revenue, pre-plant — stated plainly

As of September 2026, Stage 1 — a ₹1.5 crore entry-tier extrusion and converting plant — is at the financing and vendor-quoting stage, not yet commissioned. No revenue, users, or paid customers yet.

WHAT WE'RE TRACKING BEFORE A SINGLE SALE

TARGET: 3–5	Signed LOIs from B2B anchor buyers — gates the equipment order, not a nice-to-have.
TARGET: 3 EACH	Firm vendor quotes for the extrusion line, feedstock, and HDPE.
IN PROGRESS	GST/HSN advance ruling — a 5–12% vs. 18% swing changes the margin math.
IN PROGRESS	Ston2pack diligence — why the one branded Indian competitor went quiet since 2022–23.

These are gates, not vanity metrics — each converts into real commercial data once cleared, before capital moves.

Priced substrate-cost-up, capped so premium SKUs stay sellable

$$\text{Price} = \text{cost} + \min(\text{cost} \times 70\%, ₹2.00)$$

70% markup absorbs conversion, waste and overhead on cheap, high-volume SKUs. A ₹2.00 cap stops that percentage running away on expensive ones — a carry bag lands at ₹6.23 against a ₹5.33 laminated incumbent: a real premium a buyer can still say yes to, not 1.35× the thing we're displacing.

SKU	OUR PRICE	CONVENTIONAL INCUMBENT
Hang tag, 40×80mm	₹0.03	₹0.05
Mailer envelope, 250×350mm	₹0.34	₹0.40
Folding carton blank, 0.06m ²	₹0.85	₹1.04
Carry bag, 320×250×120mm	₹6.23	₹5.33
Wallpaper, per m ²	₹10.40	₹250–1,320 (retail category)

Every figure is substrate cost, derived from sourced ₹/tonne data – not a vendor quote yet. Real prices move with order size, print coverage, finishing and payment terms; no buyer has seen these numbers.

Stage 1: a ₹1.5 crore ceiling, debt-financed against real collateral

■ Extrusion line + in-house feedstock refining	₹65–88L	47%
■ Core converting line + conditional bag machine	₹14–25L	12%
■ Shed, utilities, installation & commissioning	₹16–21L	11%
■ Entity, registrations, PCB consent, professional fees	₹6–7L	4%
■ Working capital + closing two existing small loans	₹16.5–20.5L	11%
■ Ring-fenced reserves — salary/opex + emergency	₹18L (fixed)	11%
■ Routine contingency	₹5–7L	4%

No external equity in Stage 1. Bootstrapped against a ₹70L family shop (clear title) and ₹10L silver as collateral, plus CGTMSE-backed term debt. The two reserves are ring-fenced, not routine spend. ₹1.5 crore is a hard ceiling, not a target.

Not a check — a validation partner

Stage 1 is funded by collateral-backed debt, not equity — there's no capital ask in this application.

What would move us forward fastest is **mentorship on the gating items in our own internal reality-check**: reaching Ston2pack for diligence, building a per-SKU cash-flow model, and getting in front of real B2B buyers before we order equipment neither of us has run before.
