

FOR PROCUREMENT & PACKAGING TEAMS — SEPTEMBER 2026

Stone paper that doesn't need a tree or a litre of water

A drop-in substrate for packaging, labels, and print — made from marble waste that Rajasthan currently pays to dump.

THE MATERIAL

What it's made of, and what that gets you

Composition

- ≈80% ground limestone/marble waste (CaCO_3)
- ≈18% HDPE as binder
- ≈2% additives
- Available as sheet, roll, or converted into your product spec

Practical properties

- Tear-resistant, water-resistant — holds up where wood-pulp paper softens or tears
- Smooth, dense surface — takes print cleanly
- No wood pulp, no bleaching agents, no process water
- Comparable weight/thickness ranges to standard paper stock

WHY SWITCH

The case, in three parts

Regulatory fit

India's single-use-plastic restrictions are tightening. Stone paper is a defensible substitute for plastic-based packaging in categories where compliance officers are actively looking for alternatives.

ESG story, honestly told

Tree-free and water-free are true, verifiable claims. We do not claim "plastic-free" or "compostable" — the product is ~18% HDPE and photodegrades, it does not biodegrade. We'd rather you hear that from us than discover it later.

Input cost stability

Wood pulp prices have risen sharply and India often pays a premium versus international buyers. Our input is a waste stream with a stable, low local cost.

HOW IT'S MADE

Process and quality control

QC checkpoints

Thickness/weight tolerance at extrusion, surface finish before converting, dimensional check at cutting — every batch traceable to its production run.

Feedstock control

Refining done in-house, not bought as pre-purified powder — we control purity and particle size at the source, not downstream.

What we make today

Sheet stock

Corrugated cartons

Mono cartons

Poly mailers

Adhesive labels

Hang tags

Food packaging

Carry bags

Notebooks

Wallpaper (pipeline)

Where we stand — no rounding up

What's confirmed

- GST/Udyam registration in progress at incorporation
- PCB Consent to Establish filed as part of Stage 1 setup
- Batch-level traceability built into QC from day one

What's still open

GST/HSN classification for stone paper is not yet settled — it could be taxed as "plastic sheet" rather than "paper," which affects landed cost. We're seeking an advance ruling before scaling output, and we'll tell you the answer as soon as we have it, not after you've committed volume.

Why feedstock isn't the risk it looks like

Feedstock is abundant, not scarce

- Kishangarh's marble-slurry yard receives a truck roughly every 10 minutes at peak
- Processors want offtake — it's a disposal cost for them, not a resource they're protecting
- Multiple processor relationships, not single-source dependency

Site logistics

- Plant sited near the marble belt — feedstock travels a short distance, not cross-state
- HDPE is the one nationally-sourced input — a standard petrochemical commodity available from multiple suppliers

HOW TO START WORKING WITH US

A pilot, not a leap

This mirrors how B2B packaging buyers actually evaluate a new material — no one commits volume before a working sample. We're built for that cycle, not against it.

WHERE WE'RE FOCUSED FIRST

Segment sequencing — and why

SEGMENT	TIMING	WHY
Corporate gifting	Now	No certification barrier — fastest path to a working relationship
E-commerce mailers & cartons	Now	Direct substrate fit, high-volume, price-sensitive
Industrial labels & tags	Near-term	Fastest-growing global use case for stone paper
FMCG packaging	Once reference accounts exist	Needs technical qualification we're actively building toward

LET'S TALK

Request a sample

Tell us your spec — weight, size, use case — and we'll send test samples with lab data attached.
